

## BASE MAINTENANCE LOGISTICS

Replenishment, stock balancing and scheduled deliveries to remote MRO locations for C – and D – Checks. Includes business hours customer service centre, full supply chain visibility, reliable air freight and road freight services within CTi global network, individually agreed lead times door-to-door.

Maintenance, Repair and Overhaul (MRO) expenditures are a significant proportion of an airline's costs. CTi understands the need for optimizing your supply chain to reduce these costs, therefore we have the capability to execute your wishes, without delay.

Our operating hours work 7 days a week, 24 hours a day: every day and every hour throughout weekends and holidays. We provide line support services to the major maintenance divisions for their Airline A + B check programs, manage the Aircraft on Ground (AOG) spares, provide aero engines movement both inbound and outbound.

Vast amounts of money are lost every minute an aircraft is grounded. Equally large amounts are lost in poorly optimized, high cost inventories. As a result, aerospace corporations require a highly flexible and efficient supply chain to ensure that airlines are promptly supplied with all the required spare parts and components, from a mini-screw to a 15 – meter tail unit, anytime, anywhere.

CTi can provide the shortest lead time to meet mission critical requirements, including 24/7/365 customer service center support, full supply chain visibility, mission critical express services and individually agreed lead times from door to the point of need.

Another value added service provision includes freight forwarding and customs clearance where CTiX developed by CTi has proved to be a most innovative service. In particular, this ensures a Supply Chain Visibility and Supply Chain Events Management which is of meaningful significance to the carriers.
